In spite of sexual differences in size and wing shape, and in spite of nesting in areas of widely different oceanic productivity, Cory's Shearwaters (*Calonectris diomedea*) nesting on the island of Berlengas along the coast of mainland Portugal and those nesting on Selvagem Grande, a subtropical oceanic island between Madeira and the Canary Islands, do not differ by sex in length of incubation shift, length of foraging trips, or mass gain at sea (Ramos et al., pp. 424–432).
