BioOne Complete (complete.BioOne.org) is a full-text database of 200 subscribed and open-access titles in the biological, ecological, and environmental sciences published by nonprofit societies, associations, museums, institutions, and presses.

Your use of this PDF, the BioOne Complete website, and all posted and associated content indicates your acceptance of BioOne's Terms of Use, available at www.bioone.org/terms-of-use.

Usage of BioOne Complete content is strictly limited to personal, educational, and non - commercial use. Commercial inquiries or rights and permissions requests should be directed to the individual publisher as copyright holder.

BioOne sees sustainable scholarly publishing as an inherently collaborative enterprise connecting authors, nonprofit publishers, academic institutions, research libraries, and research funders in the common goal of maximizing access to critical research.

systematic application of DNA fingerprinting for the analysis of mating systems, and an unparalleled research program that combines the most sophisticated of modern tools with solid natural history, observation, and field experimentation. Since 1979, he has supervised 36 Ph.D. students and has hosted 33 postdoctoral research students, many of whom have gone on to academic appointments.

In addition to his own contributions to the primary literature, he has co-edited the flagship series of review books on behavioral ecology, coauthored a highly influential textbook, written two well-received popular books on his research program (one on Dunnocks, one on brood parasitism), helped launch the International Society for Behavioral Ecology (and served as its president) and its journal, *Behavioral Ecology*. In an age of tight research funding that conflicts with temptation to study exotic species in faraway lands, Professor Davies's Dunnock work merits special praise as an outstanding example of how world-class research can be accomplished through banding, experiments, and careful behavioral observations of a small, drab bird just outside one's office window.

Professor Davies has received many prestigious honors for his professional contributions, including the Scientific Medal of the Zoological Society of London (1987), the William Bate

Hardy Prize of the Cambridge Philosophical Society (1995), the Medal of the Association for the Study of Animal Behaviour (1996), and the Frink Medal of the Zoological Society of London (2001). His book *Cuckoos, Cowbirds and Other Cheats* was selected for the Best Book of the Year Award by the British Trust for Ornithology (2000). He is a Fellow of the Royal Society (1994) and was elected a Corresponding Fellow of the American Ornithologists' Union in 1999 and an Honorary Fellow in 2005.

In short, Professor Davies is the very model of a modern field ornithologist. For his untiring pursuit of scientific excellence and interesting scientific questions through the marriage of detailed natural history, theory, and clever experiments, added to his major contributions to the field of behavioral ecology, the American Ornithologists' Union is pleased to award Nicholas B. Davies the Elliott Coues Award for 2005.

Award criteria.—The Elliott Coues Award recognizes extraordinary contributions to ornithological research. There should be no limitation with respect to geographic area, subdiscipline(s) of ornithology, nor the time course over which the work was done. The award consists of a medal and an honorarium provided through the endowed Ralph W. Schreiber Fund of the American Ornithologists' Union.

WILLIAM BREWSTER MEMORIAL AWARD, 2005:

ROBERT M. ZINK

Robert M. Zink, a leading scholar in avian evolution, holds the Breckenridge Chair in Ornithology and has served as Curator of Birds at the Bell Museum of Natural History and as Professor of Ecology, Evolution, and Behavior at the University of Minnesota. Among the recurrent themes in his work are the tempo of avian diversification and speciation, species limits, phylogeny, and comparative phylogeography. Two areas deserve special mention. First is his role in creating a vigorous dialogue concerning the theory and practice of ranking taxa at the

species and subspecies levels. In this debate, which has permeated ornithological thinking for more than a century, Professor Zink and co-authors have articulated the advantages and disadvantages of the phylogenetic species concept in both theoretical and applied situations. He has been forthright in throwing down the gauntlet to challenge how current subspecific categories are being used (and misused) in conservation biology.

The second is the use of new technologies and analytical approaches in studying geographic

variation. The discipline of phylogeography—focused at the interface of population genetics and systematic biology—is central to efforts to understand the origin and maintenance of biotic diversity. Professor Zink adopted this approach with his studies of Fox Sparrows (*Passerella iliaca*), which eventually incorporated information on plumage, skeletal morphology, and mitochondrial DNA (mtDNA). This is probably the most comprehensive documentation in any bird species group. His use of multiple character systems serves as a template for modern studies of geographic variation.

He has also been instrumental in questioning the role of Late Pleistocene glaciations in the origins of many North American species, a subject that has recently been extended to Europe and Asia. His comparisons of phylogeographic structures of codistributed species have provided new insights into the evolutionary diversification of avian communities.

Professor Zink's work has been crucial in introducing new ideas to a wide audience. He continues a long tradition of ornithologists who have provided intellectual leadership in ornithology and in the larger community of evolutionary biologists. For his significant and continuing contribution to avian systematics, phylogeny, phylogeography, speciation theory, and conservation, the American Ornithologists' Union presents Robert M. Zink with the William Brewster Memorial Award for 2005.

Award criteria.—The William Brewster Memorial Award consists of a medal and an honorarium provided through the endowed William Brewster Memorial Fund of the American Ornithologists' Union. It is given annually to the author or co-authors (not previously so honored) of the most meritorious body of work on birds of the Western Hemisphere published during the 10 calendar years preceding a given AOU meeting.
