

# Acknowledgements

This book was made possible through the generous support of Jim Atkinson and Di Stockbridge who maintain a tremendous passion for the conservation of Australian wildlife. Land and Water Australia, Environment ACT, Rural Industries Research and Development Corporation, and the Australian Research Council have assisted several of our major research projects on woodlands in the past decade. Nicki Munro provided tireless assistance with many of the tasks associated with this book such as collecting literature and preparing figures and tables. Anne Findlay and Karen Viggers assisted with editing.

Nick Alexander from CSIRO Publishing championed this work through his keen support of the idea when it was first proposed. Interactions with many of our colleagues at the Centre for Resource and Environmental Studies provided much of the stimulus for this book, in particular we would like to thank Joern Fischer and Adrian Manning. Some of the ideas in this book have been influenced by a joint publication on farm forestry with David Salt and Richard Hobbs – we feel privileged to have shared research with them. We are fortunate to have worked with many remarkable private landholders in the Tumut, Nanangroe and South West Slopes regions of southern New South Wales, each of whom have a deep and long-standing appreciation of woodland environments and the need to conserve them. We are also most indebted to the staff at Environment ACT, particularly David Shorthouse, for collaborative research and study support in the woodland ecosystems of the Australian Capital Territory. Finally, many of our detailed bird surveys of woodland birds in the past ten years could not have been completed without the dedicated support of exceptional amateur ornithologists from the Canberra Ornithologists Group.

Much of this book is based on the first-rate research work completed by colleagues. We have tried to summarise as much of the ecology of temperate woodlands as possible in a limited space, but we have had to omit much material to keep the book within page limits. A text ten times as long would be required to do justice to the work of the outstanding scientists in this field. We apologise to any colleagues who feel we have short-changed their work – this was not intentional.

Parts of this book were based on earlier work we completed in the book *Wildlife on Farms*. Major contributors to that book were Andrew Claridge, Donna Hazell and Jann Williams. We are most grateful to them for their earlier efforts.

Common fringe-lilly.
