

Acknowledgements

Project Vesta brought together bushfire scientists from Ensis (formerly known as CSIRO Forestry and Forest Products (CSIRO)) and the Western Australian Department of Environment and Conservation (DEC) (formerly the Department of Conservation and Land Management (CALM)). The project has been supported by the Australasian Fire Authorities Council (AFAC) that represents State land management agencies and rural fire authorities across Australia. The Hermon Slade Foundation, the Forest and Wood Products Research and Development Corporation, Emergency Management Australia, Isuzu Trucks and a number of local government authorities in Western Australia have provided additional financial support. Fire management and research staff from land management agencies and fire authorities in New South Wales, Queensland, South Australia, Tasmania, Victoria, and the Canadian Forest Service participated in the field experiments in Western Australia over three seasons. The Bushfire Cooperative Research Centre provided support to collate additional experimental and wildfire data for model validation.

We, the authors, are grateful for the support of the Lane Poole Reserve Advisory Committee for permission to conduct the Dee Vee experiments within the Lane Poole Reserve and to very many people who have helped us in many ways. In particular, we are indebted to Rick Sneeuwjagt of DEC Fire Management Services Branch who championed the project from its inception and to the Regional Services Division of DEC which took responsibility for fire suppression during the experiments; and finally, to our project technical staff (John Neal, Bob Smith, Bruce Ward, Tim Firth and the late Alex Robinson of DEC Science Division; and Peter Hutchings and Sean Cheney of Ensis) who carried out the extensive field measurements with precision and reliability.
