

ACKNOWLEDGMENTS

We were most fortunate to obtain unstinted support from the Uganda Ministry of Animal Industry, Game and Fisheries through the unwavering interest of the Commissioners of Veterinary Services, Mr. Hugh Newlands and Mr. H. S. K. Nsubuga, their assistants and deputies, Mr. J. H. Kagoda, Mr. G. K. Binaiisa, Mr. C. L. Wright, and Mr. S. L. H. Walshe; the Chief Research Officer, Mr. Thomas Coyle, and the Acting Chief Research Officer, Mr. David Thornton. In years of increasing budget difficulties these men provided full support in personnel, facilities, equipment, supplies, travel and all other funds necessary to the work. Perhaps even more important was their continuous advice and encouragement.

Gratefully acknowledged is the support and help given by all Uganda Veterinary Department Regional and District personnel in making tick collections and advising on current conditions and future livestock development plans in their areas.

This study was made possible by financial support, advice, and encouragement by the United States Agency for International Development. The personnel of the Uganda Mission were most helpful, particularly Mr. Ned Mason, Mr. Donald Shallow, Mr. Arnold Moeller, and Dr. Aaron P. Antroinen. The USAID provided partial salary, expenses and transportation for the senior author from July 1965 to August 1966 and, through a grant to Cornell University, salary and travel expenses for the junior author and project incidentals from September 1967 to September 1968.

We are grateful to the Canadian University Service Overseas for sponsoring the junior author, providing his transportation to and returning from Uganda, and their continued encouragement, assistance, and interest throughout the project. We are grateful to the Uganda Government for employing the junior author as a Scientific Officer at the Animal Health Research Centre, Entebbe, from November 1965 to August 1967.

This work was made possible by granting of sabbatical leave to the senior author by Cornell University, including partial financial support. We are grateful to Cornell University for providing laboratory space, equipment, and secretarial help during the period from September 1967 to June 1969 when the initial manuscript was completed. We are grateful to Media Services of the College of Agriculture and Life Sciences of Cornell University for processing the photographs of ticks, for preparing base maps, and photographing the tick distribution maps. Mr. Randall Snyder helped with routine work in organizing data, preparing host lists, and mounting plates. During 1984, the College of Agriculture and Life Sciences of Cornell University provided expenses for the updating and revisions required for the final manuscript. At that time, Memorial University of Newfoundland, Canada, through the Dean of Science, supported revision accomplished by the junior author. Kathryn Matthyse did much unpaid typing and also painted the picture of *Amblyomma variegatum* for the cover.

Our thanks also go to Dr. G. Uilenberg of the FAO/UNDP Tick Project at Entebbe, for checking early copy of the manuscript at Entebbe and assisting the Uganda Government Printer.

The entomological cooperation and encouragement of the Chief Tsetse Officer of Uganda, Dr. R. Wooff, is gratefully acknowledged. The cooperation and help of Mr. H. C. M. Parr in graciously providing laboratory space, equipment, personnel, and funds from his projects during the transition period in mid-1965 are gratefully acknowledged. In turn, as Mr. Parr and certain of his personnel were on secondment from the Tropical Pesticides Research Institute, Arusha, Tanzania, the cooperation of that institute is acknowledged for permitting personnel, particularly Mr. E. P. Kanya, to work on the Tick Project.

The help of personnel of the Game Department is acknowledged for their efforts in collecting ticks from wild hosts. Particularly helpful were the Chief Game Warden, Mr. L. D. Tennant, and Mr. M. G. Trusler, Mr. R. D. Fairrie, Mr. P. W. Martin, and Mr. K. B. Robson.

We acknowledge a large collection of wild game ticks loaned to us by Mr. John Bindernagel, who was with Canadian Foreign Aid and the Uganda Game Department, working on game cropping. We also acknowledge his additional information and many helpful comments and ideas that added much to our understanding of problems in ticks of large game animals.
