BioOne Complete (complete.bioone.org) is a full-text database of 200 subscribed and open-access titles in the biological, ecological, and environmental sciences published by nonprofit societies, associations, museums, institutions, and presses.

Your use of this PDF, the BioOne Complete website, and all posted and associated content indicates your acceptance of BioOne's Terms of Use, available at www.bioone.org/terms-of-use.

Usage of BioOne Complete content is strictly limited to personal, educational, and non - commercial use. Commercial inquiries or rights and permissions requests should be directed to the individual publisher as copyright holder.

BioOne sees sustainable scholarly publishing as an inherently collaborative enterprise connecting authors, nonprofit publishers, academic institutions, research libraries, and research funders in the common goal of maximizing access to critical research.

15. STONE, R. Douglas & Martin W. CALLMANDER: Two new combinations in *Memecylon* L. (Melastomataceae) of Madagascar

Introduction

Memecylon L. (Melastomataceae) is widely distributed in the Old World tropics and consists of more than 300 species of generally small trees or shrubs, most of them occurring in the understory of evergreen forest (RENNER & al., 2007-2011). For Madagascar, the most recent treatment of the genus recognized 78 species (JACQUES-FÉLIX, 1985a, 1985b), and much of the recently collected material appears to represent species new to science (STONE, 2006). Pending completion of a comprehensive taxonomic revision of Malagasy *Memecylon*, the purpose of this note is to propose new combinations at species rank for the taxa originally described as *M. pedunculatum* var. *centrale* Jacq.-Fél. and *M. eglandulosum* var. *bezavonense* Jacq.-Fél. A lectotype is also designated for the latter. Each species is provided with observations and conservation status using the current IUCN Red List Criteria (2001).

Taxonomy and nomenclature

Memecylon centrale (Jacq.-Fél.) R. D. Stone, stat. nov.

≡ *Memecylon pedunculatum* var. *centrale* Jacq.-Fél. in Bull. Mus. Natl. Hist. Nat., B, Adansonia 6: 451. 1985.

Typus: MADAGASCAR. Prov. Antananarivo: massif d'Anorimbato, à l'Ouest d'Ambaravarana (Tsiranoanomandidy), aux confins de la haute Mahavavy et de la haute Bebao, [18°26'S 45°37'E], 15-16.V.1970, fr., Service Forestier 29170 (holo-: P [P00062672]!; iso-: K [K000 313587]!, MO [MO-313781, MO-313782]!, P [P00062673, P00062674]!, TEF [TEF000321]!).

Conservation status. – With an AOO of 18 km² and 2 subpopulations, neither of which are situated within the protected area network, *M. centrale* is assigned a preliminary status of Endangered (EN B2ab[iii]) following the IUCN Red List Categories and Criteria (IUCN, 2001) (calculation following CALLMANDER & al., 2007).

Observations. – *Memecylon centrale* appears to be a narrow endemic of forest vestiges in the Bongolava mountains, situated along the western edge of Madagascar's Central Plateau. It shares with *M. pedunculatum* Jacq.-Fél. the character of young branchlets with brownish-black bark soon exfoliating in strips to reveal whitish inner bark, as well as the character of the fruit, which is sessile above the peduncle. Its leaves however are narrowly lanceolate (dimensions 3.3-4.4 × 0.9-1.2 cm) and weakly acuminate at the apex, while in *M. pedunculatum* the leaves are ovate-lanceolate (dimensions 4.3-6.1 × 1.3-2.4 cm) and distinctly caudate-acuminate (the acumen linear, c. 1.5 cm long). Furthermore, the area inhabited by *M. centrale* is separated by c. 600 km from the region where *M. pedunculatum* occurs, in and around Marojejy National Park in northeastern Madagascar (Antsiranana Province). Species status for *M. centrale* is justified by its geographic isolation from *M. pedunculatum* and the evident lack of morphological intermediates between these taxa.

Additional specimens. – MADAGASCAR. Prov. Antananarivo: Tsiranoanomandidy, Ambaravarana, 18°25'S 45°40'E, alt. 1190-1200 m, forêt sur pente et forêt galerie, 25.VI.1997, fr., Rakotomalaza & al. 1356 (CAS, MO, P, TAN).

Memecylon bezavonense (Jacq.-Fél.) R. D. Stone, stat. nov.

≡ *Memecylon eglandulosum* var. *bezavonense* Jacq.-Fél. in Bull. Mus. Natl. Hist. Nat., B, Adansonia 7: 10. 1985.

Lectotypus (designated here): MADAGASCAR. Prov. Antsiranana: massif du Bezavona (entre la Fanambana et la Manambery), pentes inférieures de la rive droite de l'Andilana, [13°32'S 49°54'E], 20.III.1967, fl., Service Forestier 27546 (P [P00057775]!; isolecto-: P [P0005776]!, MO [MO-345892, MO-391665]!, TEF!).

Conservation status. – With an EOO of > 100 km², an AOO of 18 km² and 2 subpopulations, neither of which are situated within the protected area network, *M. bezavonense* is assigned a preliminary status of Endangered (EN B1ab[iii]);

B2ab[iii]) following the IUCN Red List Categories and Criteria (IUCN, 2001) (calculation following CALLMANDER & al., 2007).

Observations. – This species is evidently restricted to dry, semi-deciduous forests in northeastern Madagascar. Its description as a variety of *M. eglandulosum* H. Perrier was seemingly based on floral characters, which were said to be identical between the two taxa (JACQUES-FÉLIX, 1985b: 12). Additional

collections have revealed that the fruits of *M. bezavonense* are characteristically asymmetrical and have a distinct calycinal crown, quite unlike the fruits of *M. eglandulosum* which are larger, globose and have a stylopodium projecting past the truncate rim of the calyx (Fig. 1). Species status for *M. bezavonense* is further justified by its smaller, oblanceolate leaves (dimensions 4-5 × 1.2-1.8 cm) in comparison to the larger, ± elliptic leaves of *M. eglandulosum* (dimensions 5-7.5 × 2-3 cm).

Additional specimens. – MADAGASCAR. Prov. Antsiranana: type loc., 13.XII.1966, st., Service Forestier 27239-bis (P, TEF); Antsiranana II, Andrafabe, Saharenana, lieu de récolte Andranomadio-Sahafary, 3 km au Sud-Est du village de Saharenana, 12°36'26"S 49°26'21"E, alt. 227 m, forêt sèche semi-caducifoliée, 10.XI.2004, fr., Rakotondrajaona & al. 342 (CAS, MO, P, TAN). S. loc.: s.d., fr., Service Forestier 29413 (TEF).

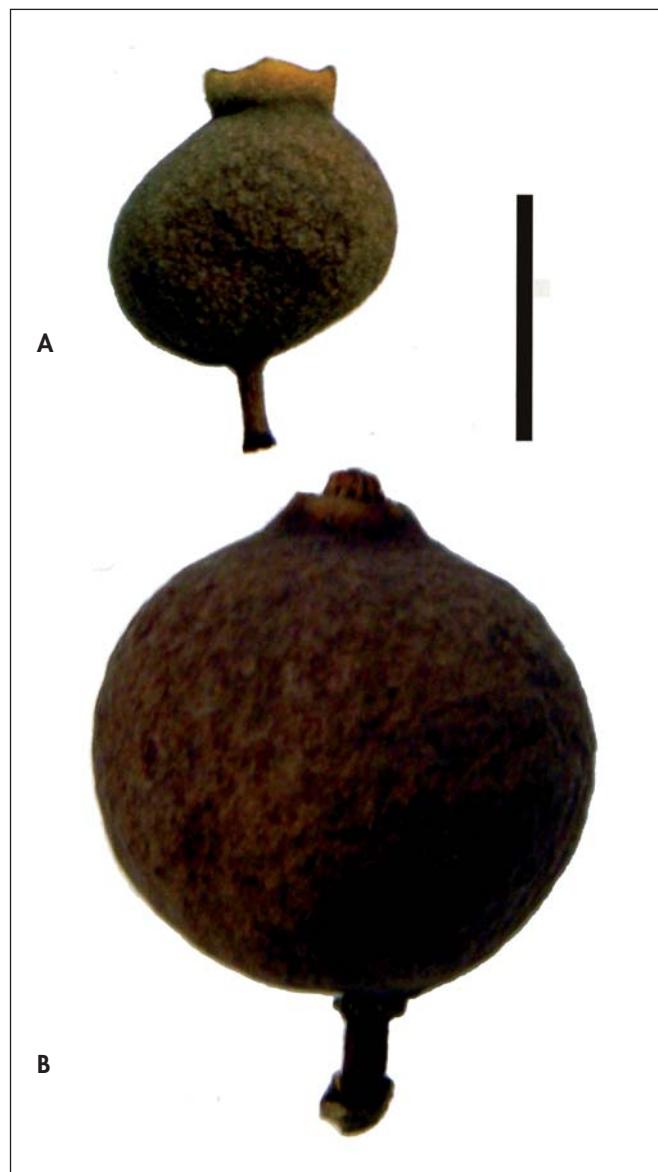

Fig. 1. – Comparison of fruit morphology (scale bar = 1 cm). **A.** Fruit of *Memecylon bezavonense* (Jacq.-Fél.) R. D. Stone [Rakotondrajaona & al. 342, CAS]. **B.** Fruit of *Memecylon eglandulosum* H. Perrier [Madiomanana & al. 196, NU].

Acknowledgements

Support from the California Academy of Sciences (John J. Rose Postdoctoral Fellowship) is gratefully acknowledged. Curators of the following herbaria are thanked for allowing access to specimens: BR, G, K, MO, P, TEF.
